

## Objective

This code example demonstrates how to implement a low-power CapSense button with an average current consumption of 6  $\mu$ A per button.

## Overview

This code example implements a CapSense button. Using the low-power modes available in the PSoC device, an average current of 6  $\mu$ A is achieved for a button sensor when no touch is present. The example supports a CapSense tuner to read the CapSense debug data such as raw count, baseline, and difference count.

## Requirements

**Tool:** PSoC Creator™ 4.1 and later versions

**Programming Language:** C (ARM® GCC 5.4.1, ARM MDK)

**Associated Parts:** All PSoC 4, PSoC 4 M-Series, PSoC 4 L-Series, PSoC 4 S-Series, PSoC 4 BLE, and PSoC 4 BLE devices

**Related Hardware:** [CY8CKIT-041-40XX](#), [CY8CKIT-041-41XX](#), [CY8CKIT-042](#), [CY8CKIT-044](#), [CY8CKIT-046](#), and [CY8CKIT-042-BLE](#).

## Design

The project demonstrates the core functionality of the CapSense Component. [Figure 1](#) shows the PSoC Creator schematics of this code example. This code example uses CapSense, EZI2C Slave, and Global Signal Reference Components.

The CapSense Component is configured with a one-button widget. The project uses the CapSense Sigma Delta (CSD) manual tuning mode with Current output Digital to Analog Converter (IDAC) auto-calibration enabled. The EZI2C Slave Component is used to monitor the sensor data and slider touch position information on a PC using the CapSense tuner available in the PSoC Creator IDE via I<sup>2</sup>C communication.

To reduce the power consumed by the PSoC device and provide an optimum touch response, this code example implements two modes: Fast Scan Mode and Slow Scan Mode. When the user is interacting with the buttons, the PSoC device is in the Fast Scan Mode and when the user is not interacting with the buttons for a specific duration, the Slow Scan Mode is used.

In the Fast Scan Mode, the button sensor is scanned at a refresh rate of 33 Hz (or scan interval of 30 ms). The PSoC device is put to Deep Sleep after the CapSense data is processed. The Global Signal Reference Component, which is configured as a watchdog timer (WDT) is used to periodically wake up the device from Deep Sleep mode. This mode provides the optimum touch response, but consumes a higher average current (< 30  $\mu$ A) when compared to the Slow Scan Mode.

The Slow Scan Mode is similar to the Fast Scan Mode except that the refresh rate is 5 Hz (or scan interval is 200 ms). The Slow Scan Mode consumes a lower average current of 5  $\mu$ A per button, but with a slower touch response. Once a touch is detected in the Slow Scan Mode, the PSoC device switches to the Fast Scan Mode to provide an optimum touch response at the expense of a higher current consumption.

The firmware flowchart is shown in [Figure 2](#).

Figure 1. Top Design

## CE210291 PSoC4 CapSense Low Power One Button

This code example demonstrates how to implement a low-power CapSense button with an average current consumption of 6uA per button.

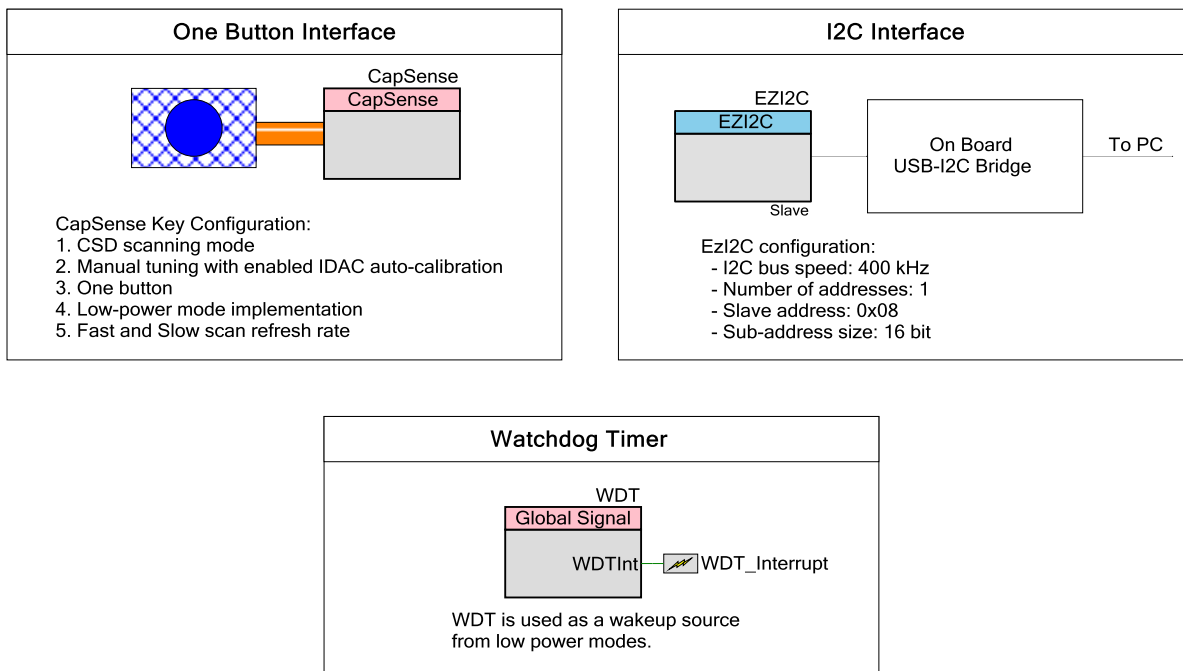

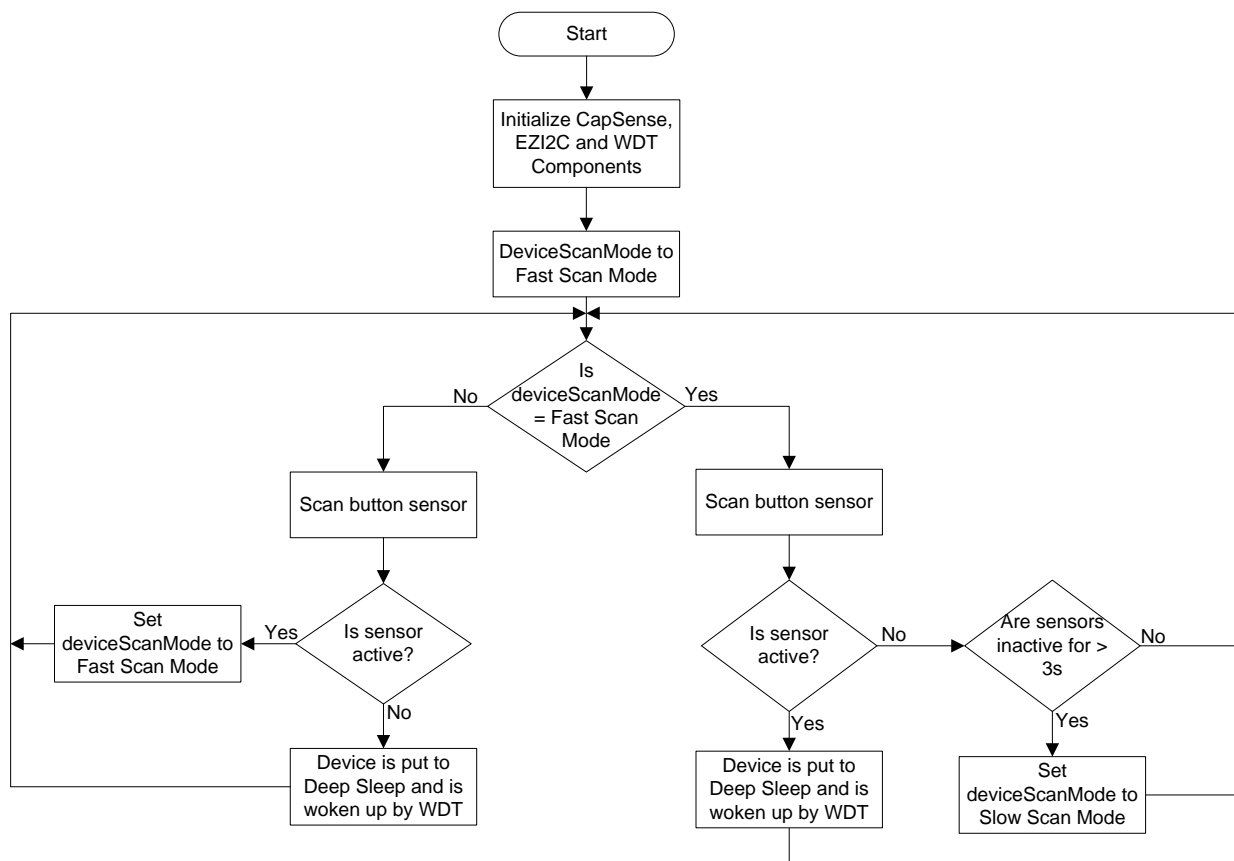

Figure 2. Firmware Flowchart

## Design Considerations

The code example is designed for PSoC 4000S and the associated CY8CKIT-041-40XX kit. The design is easily portable to other PSoC 4 devices and kits, typically by just changing the device and pin assignments.

To switch from CY8CKIT-041-40XX to other PSoC 4 pioneer kits, follow the steps below:

1. Select the appropriate device with the Device Selector called from the project's context menu (Figure 3). Table 1 lists the device number for each pioneer kit.

Figure 3. Select Device Selector from Project's Context Menu

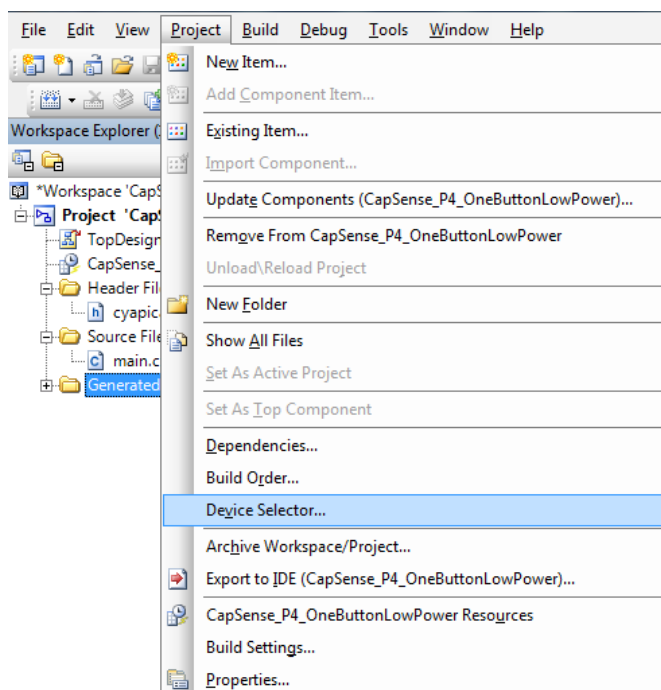

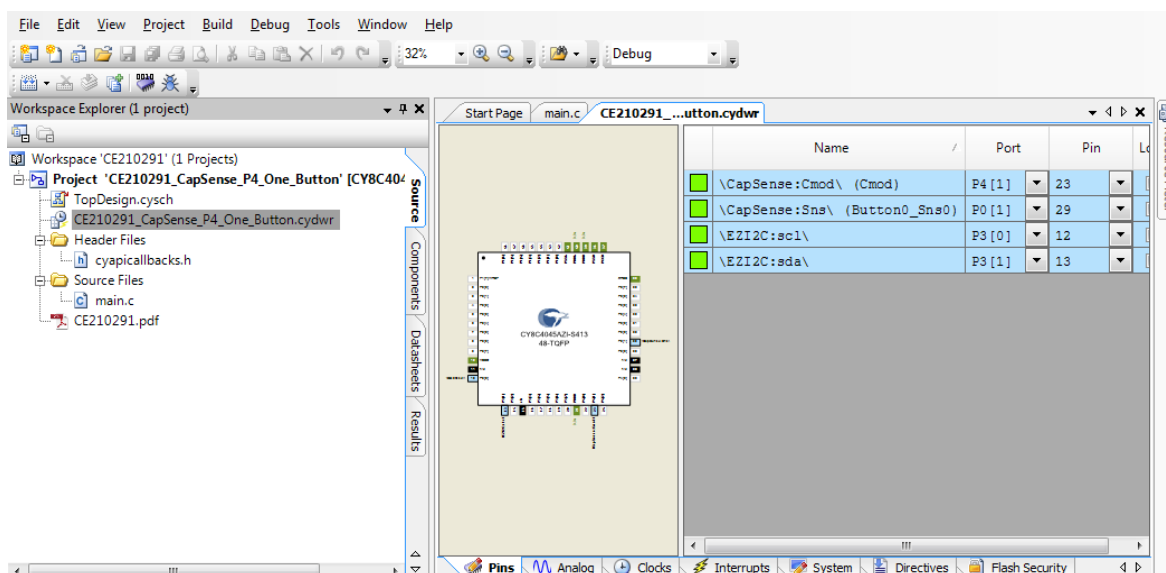

Table 1. Pin Assignment for the PSoc4 CapSense Low-Power One Button Project

Pin name	Development Kits					
	CY8CKIT-041-40XX (CY8C4045AZI-S423)	CY8CKIT-041-41XX (CY8C4146AZI-S433)	CY8CKIT-042 (CY8C4245AXI-483)	CY8CKIT-042-BLE (CY8C4247LQI-BL483)	CY8CKIT-044 (CY8C4247AZI-M485)	CY8CKIT-046 (CY8C4248BZI-L489)
\Capsense: Cmod\	P4[1]	P4[1]	P4[2]	P4[0]	P4[2]	P4[2]
\CapSense: Sns[0]\ (Button0_Sns0)	P0[1]	P0[1]	P1[1]	P2[1]	P4[4]	P0[6]
\EZI2C: scl\	P3[0]	P3[0]	P3[0]	P3[5]	P4[0]	P4[0]
\EZI2C: sda\	P3[1]	P3[1]	P3[1]	P3[4]	P4[1]	P4[1]

When you select the device, pins are assigned automatically in the design wide resource file according to the device selected.

**Note:** If the assigned pins are not as shown in [Table 1](#) or you want to overwrite the existing pin assignments, double-click the project's design wide resource (DWR) file ([Figure 4](#)) in the workspace explorer window and assign the pins. See the device datasheet to learn about how to use other pins.

Figure 4. Pin Assignments in Project's Design Wide Resource File

2. Select 3.3 V as supply by using switch SW5. For other kits, refer to the kit [user guide](#).
3. Build the project and ensure that there are no errors or warnings.

**Note:** For a PSoC 4 device, before building the project, the modulator clock frequency should to be set to 12 MHz instead of 24 MHz because the maximum frequency supported is 12 MHz.

## PSoC Creator Components

Table 2 lists the PSoC Creator Components used in this example, as well as the hardware resources used by each Component.

Table 2. List of PSoC Creator Components

Component	Instance Name	Component Version	Hardware Resources
CapSense	CapSense	v4.0	CSD, and 2 GPIO pins
EZI2C Save (SCB mode)	EZI2C	v3.20	SCB, 2 GPIO pins
Interrupt	WDT_Interrupt	v1.70	Interrupt
Global Signal Reference	WDT	v2.10	Watchdog Timer

## Parameter Settings

### CapSense

Figure 5, Figure 6 and Figure 7 show the settings for CapSense Component. See the [CapSense component datasheet](#) for additional information.

## Operation

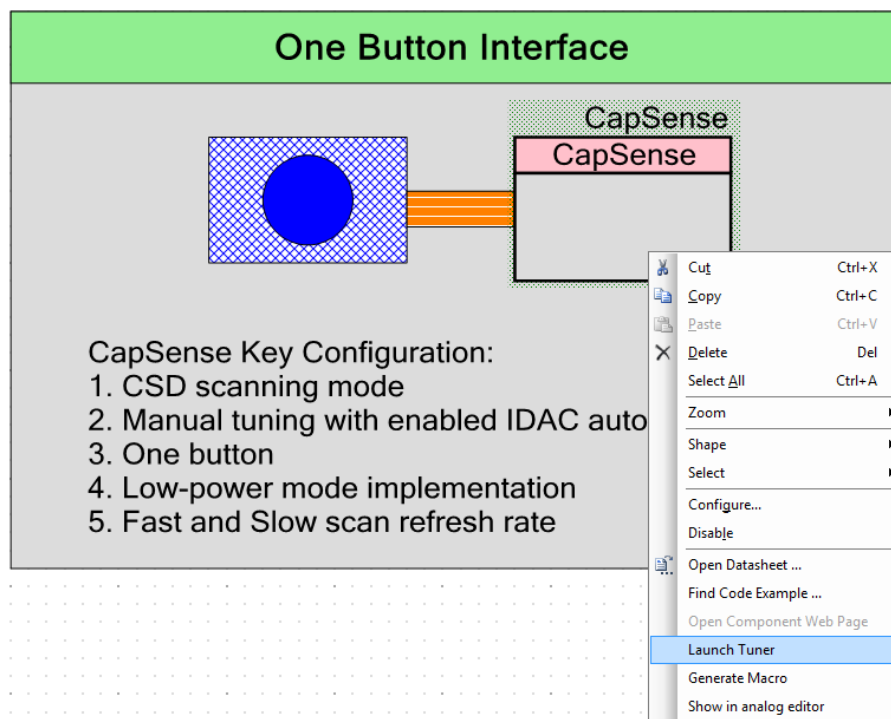

Follow the steps below to test the project on CY8CKIT-041:

1. Plug the CY8CKIT-041-40XX board into your computer's USB port and program the project into the kit. Refer to the kit user guide for details on steps for programming.
2. Connect an ammeter between test points P4.VDD and VDD on the CY8CKIT-041-40XX board. Refer to the kit user guide "Current Measurement Switch" section for complete details on power measurement steps.
3. Touch the left button on the kit and confirm that the current displayed on the ammeter in Fast Scan Mode is ~30  $\mu$ A.
4. Release the finger from the button and wait for 3 seconds. Note that the current displayed on the ammeter in Slow Scan Mode is ~6  $\mu$ A.

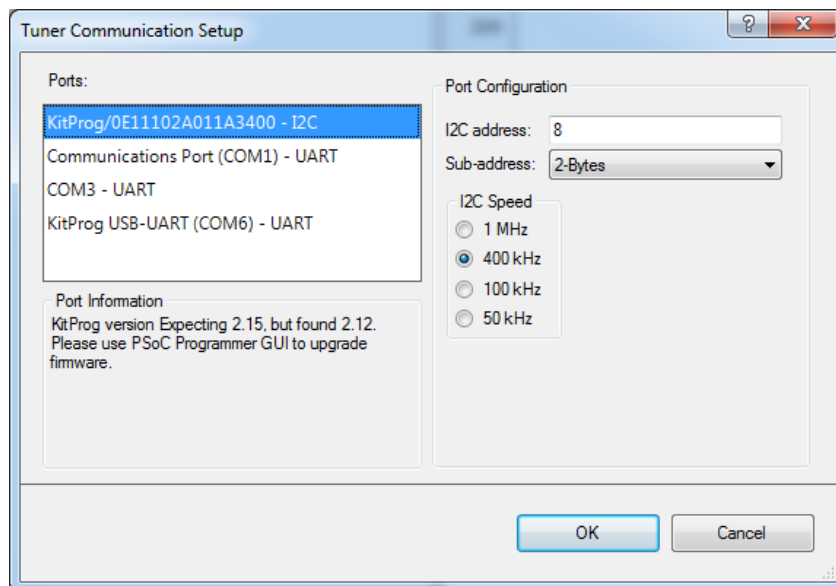

5. By default, the parameters updated in tuner are not written to the firmware. To enable this, set the macro `TUNER_UPDATE_ENABLE` to '1' in the `main.c` file. Then build the project and program the device. Note that additional current will be consumed if the conditional code is enabled.
6. To launch the Tuner GUI, right-click the CapSense Component as shown in [Figure 11](#). Then select Launch Tuner in the menu.

Figure 11. Launch Tuner GUI

7. Navigate to Tools/Protocol Settings in the Tuner GUI menu to set up the I2C communication ([Figure 12](#)).
  - Select the I2C port of the kit in the Ports menu.
  - Choose the I2C address, sub-address size, and speed as shown in [Figure 12](#).

Figure 12. Setting up I2C Communication

8. In the tuner GUI, click the **Connect** button followed by **Start** button (Figure 13).

Figure 13. Starting Communication

9. After establishing the I2C communication between the device and Tuner GUI, you can observe the sensor data and the button touch status.
10. Figure 14 and Figure 15 show sensor debug data such as difference count, raw count, and baseline.

## PSoC Resources

Cypress provides a wealth of data at [www.cypress.com](http://www.cypress.com) to help you select the right PSoC device, and quickly and effectively integrate the device into your design. For a comprehensive list of resources, see [KBA86521](#), [How to Design with PSoC 3](#), [PSoC 4](#), and [PSoC 5LP](#). The following is an abbreviated list for PSoC 4:

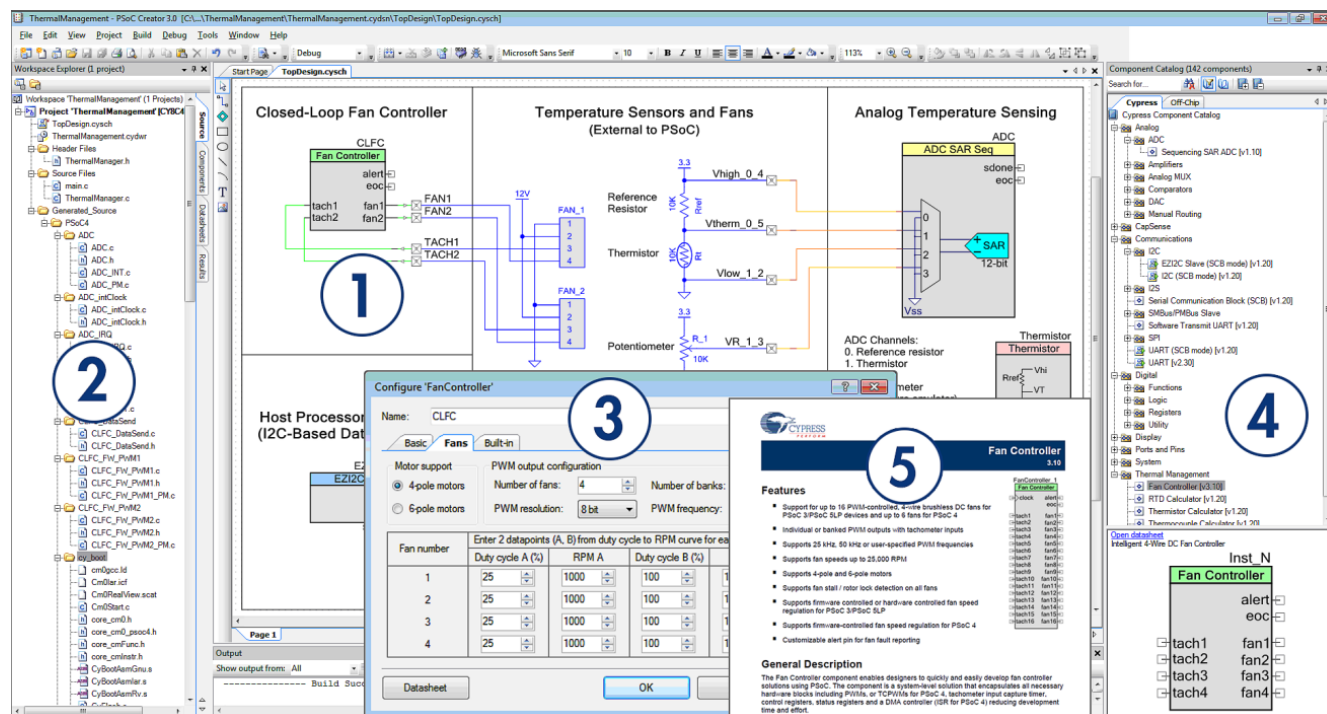

- **Overview:** [PSoC Portfolio](#), [PSoC Roadmap](#)
- **Product Selectors:** [PSoC 1](#), [PSoC 3](#), [PSoC 4](#), or [PSoC 5LP](#). In addition, [PSoC Creator](#) includes a device selection tool.
- **Datasheets:** Describe and provide electrical specifications for the [PSoC 4000](#), [PSoC 4000S](#), [PSoC 4100S](#), [PSoC 4100](#), and [PSoC 4200](#), [PSoC 4xx7 BLE](#), [PSoC 4200-M](#) and [PSoC Analog Coprocessor](#) device families
- **CapSense® Design Guide:** Learn how to design capacitive touch-sensing applications with the PSoC 4 family of devices.
- **Application Notes and Code Examples:** Cover a broad range of topics, from basic to advanced level. Many of the application notes include code examples. PSoC Creator provides additional code examples.
- **Technical Reference Manuals (TRM):** Provide detailed descriptions of the architecture and registers in each PSoC 4 device family.
- **PSoC Training Videos:** These videos provide step-by-step instructions on getting started building complex designs with PSoC.
- **Development Kits:**
  - [CY8CKIT-040](#), [CY8CKIT-041-40xx](#), [CY8CKIT-041-41xx](#), [CY8CKIT-042](#), [CY8CKIT-042-BLE](#), [CY8CKIT-044](#) and [CY8CKIT-048](#) PSoC Pioneer Kits are easy-to-use and inexpensive development platforms. These kits include connectors for Arduino™ compatible shields and Digilent® Pmod™ daughter cards.
  - [CY8CKIT-049](#) is a very low-cost prototyping platform for sampling PSoC 4 devices.
  - [CY8CKIT-001](#) is a common development platform for all PSoC family devices.
- The [MiniProg3](#) device provides an interface for flash programming and debug.

## PSoC Creator

PSoC Creator is a free Windows-based Integrated Design Environment (IDE). It enables concurrent hardware and firmware design of systems based on PSoC 3, PSoC 4, and PSoC 5LP. See Figure 16– with PSoC Creator, you can:

1. Drag and drop Components to build your hardware system design in the main design workspace
2. Codesign your application firmware with the PSoC hardware
3. Configure Components using configuration tools
4. Explore the library of 100+ Components
5. Review Component datasheets
