

Objective

This code example demonstrates the implementation of CapSense® linear slider and buttons and LED control. It sends information on CapSense linear slider and buttons over I²C to the CapSense Tuner or EZ-BLE™ PSoC™ Module on the CY8CKIT-145-40XX PSoC® 4000S Prototyping Kit. It also demonstrates a simple breathing LED using the SmartIO and TCPWM Components.

Overview

This code example demonstrates the operation of a CapSense linear slider with five segments and three CapSense buttons. Data from the CapSense linear slider and buttons is sent to the CapSense Tuner or EZ-BLE PSoC Module using I²C communication. The CapSense linear slider touch position and button status are used to turn ON/OFF corresponding LEDs on the kit. It also demonstrates the connectivity between the EZ-BLE PSoC Module (acting as a Peripheral and GATT server device) and mobile device running the CySmart™ mobile application (acting as a Central and GATT client device). This code example also demonstrates a simple breathing effect of LED with breath-in and breath-out rate of 1 Hz using the SmartIO and TCPWM (configured as PWM) Components.

Requirements

Tool: PSoC Creator™ 4.2

Programming Language: C (Arm® GCC 5.4.1)

Associated Parts: All PSoC 4000S parts

Related Hardware: CY8CKIT-145-40XX PSoC 4000S Prototyping Kit

Hardware Setup

This example uses the CY8CKIT-145-40XX PSoC 4000S Prototyping Kit's default configuration. See the kit guide to make sure the kit is configured correctly.

Software Setup

None.

Operation

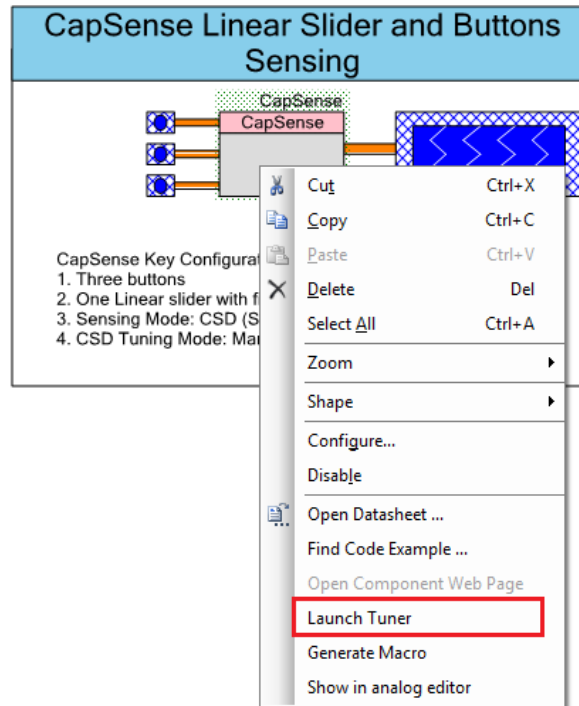

Follow these steps to verify the code example:

1. Select the *CE210709_CapSense_Linear_Slider_and_Buttons.cywrk* file in the PSoC Creator Start page under **Examples and Kits > Kits > CY8CKIT-145-40XX**. Select a location to save the code example.
2. Build the project (select the PSoC Creator menu item **Build > Build CE210709_CapSense_Linear_Slider_and_Buttons**).
3. Connect the PSoC 4000S Prototyping Kit to your computer's USB port.
4. Push the SWD Select switch (SW4) to the PSoC 4000S position to program the PSoC 4000S device.
5. Program the PSoC 4000S device (select **Debug > Program**). Blue LED (LED1) glows with breathing effect.
6. Touch the CapSense buttons and observe that the corresponding LEDs turn ON.
7. Slide your finger over the CapSense linear slider and observe that the LEDs turn ON depending on the touch position.

Verifying Code Example Using the CapSense Tuner

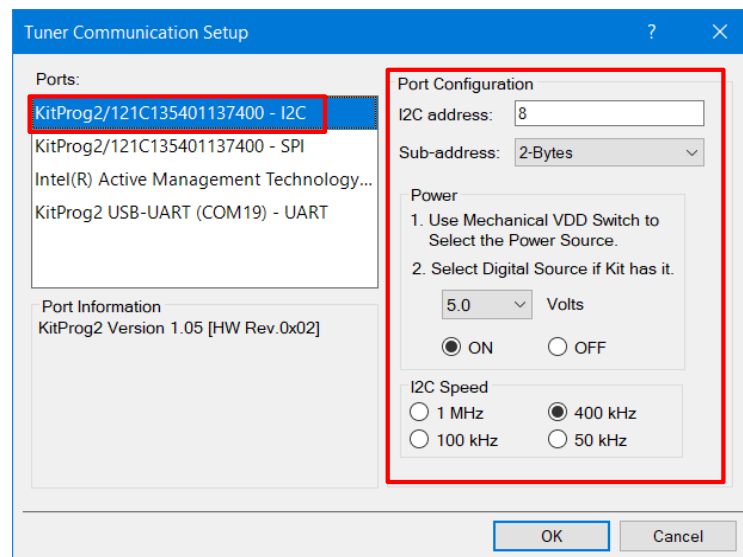

1. Launch the CapSense Tuner. Right-click the CapSense Component and select **Launch Tuner** from the menu as shown in Figure 1.

Figure 1. Launch Tuner GUI

2. Navigate to **Tools > Tuner Communication Setup** in the CapSense Tuner GUI menu to set up the I²C communication (Figure 2).
 - Select **KitProg2/<serial_number> - I2C**
 - Choose the I²C address, sub-address size, and speed as used in EZI2C configuration (Figure 2) and click **OK**.

Figure 2. Setting up I²C Communication

- Click **Connect** and then **Start** as shown in [Figure 3](#) and [Figure 4](#).

Figure 3. CapSense Tuner Connect Button

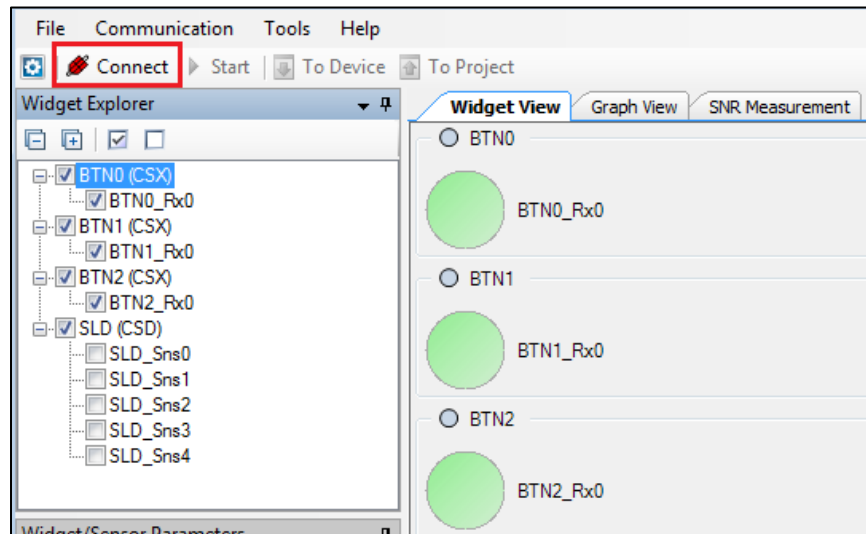

Figure 4. CapSense Tuner Start Button

After establishing the I²C communication with the CapSense Tuner, you can observe the touch position on the CapSense linear slider (centroid) and CapSense button state (ON/OFF).

[Figure 5](#) and [Figure 6](#) show the scanning results for all the sensing elements.

Figure 5. CapSense Tuner: Widget View of CapSense Buttons and Linear Sliders

Figure 6. CapSense Tuner: Graph View of CapSense Linear Slider

Verifying Code Example Using the CySmart Mobile Application

To verify the CapSense linear slider operation using the CySmart mobile application, make sure that your mobile phone has the CySmart application installed. See the [CySmart Mobile Application webpage](#) and then follow the steps listed below:

1. Open the *main.c* file corresponding to CE210709_CapSense_Linear_Slider_and_Buttons project and change the ENABLE_TUNER macro value to '0u'.
Note: When the ENABLE_TUNER macro value is '0u', the PSoC 4000S device sends the data only to the Bluetooth Low Energy (BLE) CapSense Service. Change the ENABLE_TUNER macro value to '1u' to use the CapSense Tuner.
2. Build the project (select the PSoC Creator menu item **Build > Build CE210709_CapSense_Linear_Slider_and_Buttons**).
3. Program the PSoC 4000S device; select **Debug > Program**.
4. In the Workspace Explorer, right-click the CE210709_EZ-BLE_Peripheral project and select **Set As Active Project**.
5. Build the project (select the PSoC Creator menu item **Build > CE210709_EZ-BLE_Peripheral**).
6. Push the SWD Select switch (SW4) to the 'EZ-BLE' position to program the EZ-BLE PSoC Module.
7. Program the EZ-BLE PSoC Module (select **Debug > Program**).
8. Open the CySmart application on the mobile device. If Bluetooth is not enabled on the device, the application will prompt to enable it.

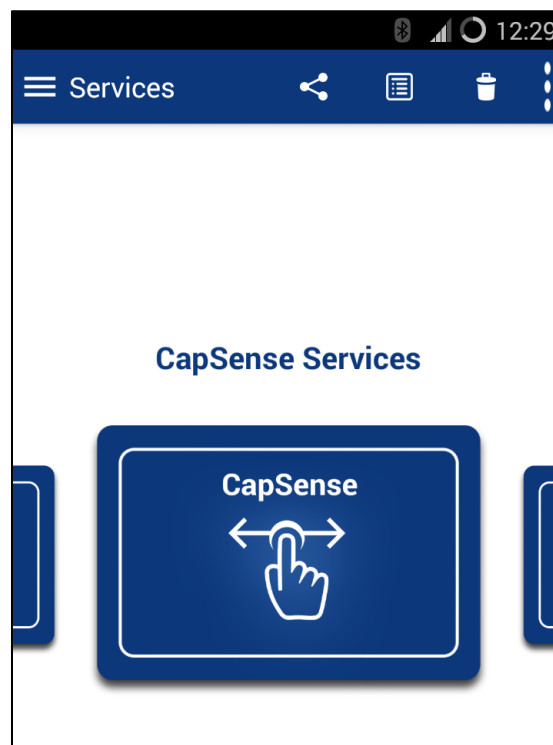

9. After Bluetooth is enabled, the CySmart mobile application will automatically search for available peripherals and list them. Select the **CY8CKIT-145** peripheral as shown in [Figure 7](#).

Figure 7. CY8CKIT-145 Peripheral

10. When connected, the CySmart mobile application will list the profiles supported by the peripherals. Scroll and select the CapSense icon, as shown in [Figure 8](#).

Figure 8. CapSense Service Page

11. Swipe your finger on the CapSense linear slider on the kit and see a similar response on the CapSense page in the CySmart application, as shown in [Figure 9](#).

Figure 9. CapSense Slider

Design and Implementation

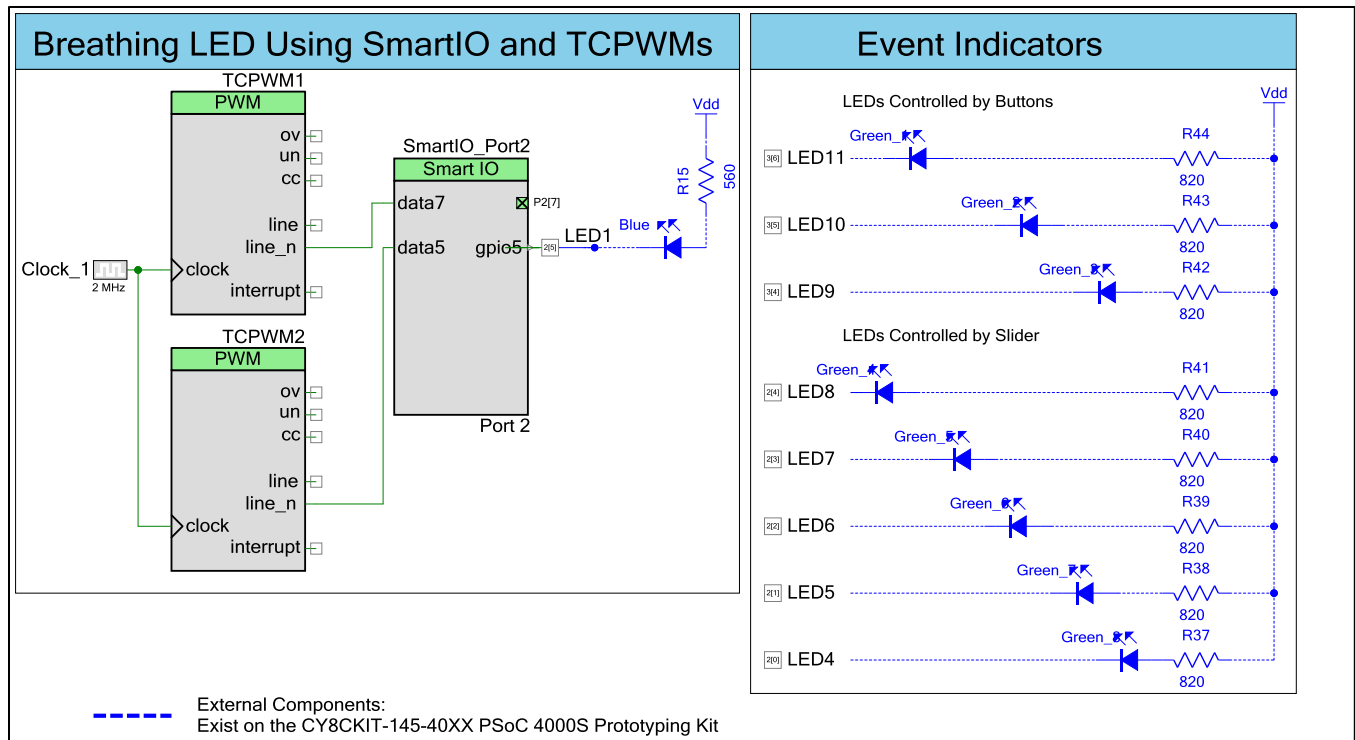

This code example has two PSoC Creator projects in a single workspace - CE210709_CapSense_Linear_Slider_and_Buttons and CE210709_EZ-BLE_Peripheral.

CE210709_CapSense_Linear_Slider_and_Buttons

[Figure 10](#) shows the PSoC Creator schematics of the CE210709_CapSense_Linear_Slider_and_Buttons project. This project uses CapSense, EZI2C Slave, PWM, Pin, Clock, and SmartIO Components.

Figure 10. PSoC Creator Schematics for CE210709_CapSense_Linear_Slider_and_Buttons

The CapSense Component is configured with one linear slider widget with five segments and three button widgets. This project uses the CapSense Sigma-Delta (CSD) manual tuning mode with IDAC auto-calibration enabled. When the CapSense linear slider is touched, depending on the touch position, the corresponding LEDs are turned ON as shown in [Table 1](#). In the case of CapSense buttons, if a touch is detected, corresponding LEDs are turned ON.

Table 1. LEDs State Depending on the Finger Position on CapSense Linear Slider

Finger Position (Centroid) on CapSense Linear Slider (C) ¹	LED8	LED7	LED6	LED5	LED4
No touch	OFF	OFF	OFF	OFF	OFF
0% ≤ C ≤ 20% (1 st Segment of CapSense Linear Slider)	OFF	OFF	OFF	OFF	ON
20% < C ≤ 40% (2 nd Segment of CapSense Linear Slider)	OFF	OFF	OFF	ON	ON
40% < C ≤ 60% (3 rd Segment of CapSense Linear Slider)	OFF	OFF	ON	ON	ON
60% < C ≤ 80% (4 th Segment of CapSense Linear Slider)	OFF	ON	ON	ON	ON
80% < C ≤ 100% (5 th Segment of CapSense Linear Slider)	ON	ON	ON	ON	ON

¹ Touch position from segment 0 (SLD0) as a percentage of CapSense linear slider length.

The EZI2C Slave Component is used to monitor the sensor data on the PC using the CapSense Tuner available in the PSoC Creator integrated design environment (IDE). The CapSense linear slider touch position can also be viewed in the CySmart mobile application when data is sent to the EZ-BLE PSoC Module. When the CapSense Tuner is disabled in firmware, the CapSense linear slider touch position and button ON/OFF status is sent to the EZ-BLE PSoC Module on the PSoC 4000S Prototyping Kit via I²C using EZI2C Slave Component.

In this project, an LED (LED1) is used to demonstrate the breathing effect. As shown in [Figure 11](#), the breathing effect of LED is generated by XORing two PWM signals that have slightly different frequencies with a duty cycle of 50%. The XOR gate is implemented using the SmartIO Component. The SmartIO Component is configured in combinatorial mode with the Look-Up-Table (LUT) configured for an XOR gate implementation. The two PWMs are of 100 Hz and 101.01 Hz frequency. Routing these PWM signals through an exclusive-OR (XOR) gate yields an output signal with a gradually changing duty cycle. Driving an LED with this signal results in a “breathing” effect, where the LED gradually gets brighter and dimmer. The rate of change is proportional to the difference between the PWM output frequencies.

Figure 11. LED Breathing Effect by XORing Two PWM Signals

Figure 12. Firmware Flowchart

CE210709_EZ-BLE_Peripheral

Figure 13 shows the PSoC Creator schematics of CE210709_EZ-BLE_Peripheral project. This project uses BLE and I²C Components.

Figure 13. PSoC Creator Schematics for CE210709_EZ-BLE_Peripheral

The I²C Component configured in Master mode is used to receive the CapSense buttons ON/OFF status and linear slider touch position from the PSoC 4000S device on the PSoC 4000S Prototyping Kit.

The **Custom** profile in this project consists of a single BLE Custom Service - **CapSense**. The **CapSense** Service consists of Custom Characteristics - **CapSense Slider** and **CapSense Button**. The **CapSense Slider** Characteristic is used to send one-byte data, ranging from 0 to 100, as a notification to the GATT client device. This data is the finger location read by the CapSense Component on the 5-segment linear slider present on the kit. The **CapSense Button** Characteristic is used to send the number of buttons and their ON/OFF status, as a notification to the GATT client device. For more details on the CapSense Service implementation, see the [Cypress CapSense Service](#) guide.

Components and Settings

Table 2 and Table 3 list the PSoC Creator Components used in this example, how they are used in the design, and the non-default settings required so they function as intended.

Table 2. List of PSoC Creator Components in the CE210709_CapSense_Linear_Slider_and_Buttons Project

Component	Instance Name	Purpose	Non-default Settings
CapSense	CapSense	Scan 5-segment linear slider and three CapSense buttons	See Figure 14 through Figure 18
EZI2C Slave (SCB mode)	EZI2C	I ² C Slave operation	See Figure 19
PWM (TCPWM mode)	TCPWM1	Generate square wave and bring out the signal to GPIO	See Figure 20 and Figure 21
	TCPWM2		
Clock	Clock_1	Drive the PWM at 2 MHz	See Figure 22
Digital Output Pin	LED1	Drive the SmartIO output to LED	External terminal: Checked
	LED4	Firmware controlled digital output pins that control status LEDs	See Figure 23
	LED5		
	LED6		
	LED7		
	LED8		
	LED9		

Component	Instance Name	Purpose	Non-default Settings
	LED10		
	LED11		
SmartIO	SmartIO_Port2	Implement XOR gate for two PWM signals	See Figure 24 and Figure 25

Table 3. List of PSoC Creator Components in CE210709_EZ-BLE_Peripheral Project

Component	Instance Name	Purpose	Non-default Settings
Bluetooth Low Energy (BLE)	BLE	Establish BLE connectivity. Custom services are used for notifying the BLE Central device of CapSense slider and button data.	See Figure 26 for Profile tab settings. For details on other non-default settings, open the Component Configuration window.
I ² C (SCB mode)	I2CHW	I ² C Master operation	See Figure 27

For information on the hardware resources used by a Component, see the Component datasheet.

Reusing This Example

This example is designed for the CY8CKIT-145-40XX PSoC 4000S Prototyping Kit. To port the design to a different PSoC 4 device, kit, or both, change the target device using the Device Selector and update the pin assignments in the Design Wide Resources Pins settings as needed.
